My research is in developing methods for robotic perception and control that can enable robots to operate in cluttered, unknown environments. My approach is to design new deep learning and other machine learning algorithms that can enable a robot to learn how its environment changes over time. By teaching robots to understand and affect environmental changes, I hope to open the door to many new robotic applications for operating in messy, cluttered environments, such as robots for our homes, assisted living facilities, schools, hospitals, or disaster relief areas.
